

Session 1

Task - 1

Task – 2

1. Report View

Report View is used to create and design reports in Power BI. It allows users to add charts, tables, cards, slicers, and other visualizations.

2. Data View

Data View allows users to view the data loaded into Power BI in a table format. It is useful for checking and understanding the data before creating visuals.

3. Model View

Model View is used to view and manage relationships between different tables. It helps users understand how tables are connected within the data model.

4. Fields Pane

The Fields Pane displays the tables, columns, and measures available in the Power BI data model. Users can select these fields and use them to create visualizations.

5. Visualizations Pane

The Visualizations Pane contains different types of charts and visual elements that can be added to a report. It also provides options to format and customize visuals.

6. Filters Pane

The Filters Pane is used to filter the data displayed in a visual, report page, or the entire report. It helps users focus on specific data.

Task – 3

Task – 4

1. Data Handling

Excel dashboards mainly work with Excel worksheets, tables, PivotTables, and PivotCharts. Power BI can connect to multiple data sources and combine data for analysis.

2. Visualization and Interactivity

Excel provides charts, PivotCharts, slicers, and other visualization features.

Power BI provides a wider range of interactive visuals, allowing users to explore and analyze data more dynamically.

3. Data Modeling

Excel uses formulas, PivotTables, and Power Pivot for data analysis and modeling.

Power BI has a dedicated Model View that makes it easier to create relationships between multiple tables and build data models.
